Building the Unreal Game from Your Phone

You can start builds of the PC game from your Android phone while away from home, as long as your PC stays switched on and connected to the internet.

Two ways to build from your phone

1. **A build machine on your PC.** Your PC is registered with GitHub as its own build machine. When code is pushed from a chat on your phone, your PC at home picks it up and builds the game automatically, much like the Babylon releases now.
2. **Claude Code running at home.** Claude Code on your PC can be reached from the Claude app on your phone. You give commands from anywhere, and it works right there on your PC: building, running editor scripts and fixing errors. The exact setup gets checked together on Monday.

Seeing and playing the result while away

A remote-desktop app such as Parsec or Steam Link streams your PC's screen to your Android phone. You can watch the build, check the game and even walk through the terminal that way.

What has to be true

- The PC is switched on while you are away.
- The PC is connected to the internet.
- The Android phone has a decent connection for streaming the screen.
