Usage Tips and the Unreal Globe Plan

Tips for building and publishing Airport Dynasty Pro without using up the weekly limit too fast.

1. Collect changes, then publish once

Every build and publish round uses a lot. Gather several fixes and features and release them together, maybe once or twice a day, instead of after every small change.

2. Skip the waiting

When publishing, Claude sometimes waits and checks the build for several minutes. Say "push and don't follow the build", and check the release yourself.

3. Fewer test renders

Screenshots and test renders are among the most expensive steps. Ask for them only when the look really matters, and test on your own device the rest of the time.

4. Ask for short answers

Long explanations and reading back long messages cost usage too. When you just want it done, say "do it, short summary".

5. New chat for each big topic

Long chats get more expensive with every message, because everything before is carried along. Start a fresh chat for a new feature; Claude picks up from its notes and the project.

6. Be specific up front

Exact names, places and examples save searching and rounds of fixes.

7. Voice is fine for planning

Talking things through is cheaper than building. Plan by voice, then send one clear build request.

8. Pause big unknowns

For big features, ask for a short plan first, then say go. That avoids building the wrong thing.

The biggest savers

Numbers 1, 3 and 5.

Plan: the whole globe in the Unreal version, no monthly fees

Real mountains, rivers, lakes and coastlines across the whole globe, built from free data that allows commercial use with a credit. Customers never pay anything.

Part	Source	Cost
Streaming the globe	Cesium for Unreal plugin (open source)	Free
Large areas you build (the terminal)	World Partition, part of Unreal Engine	Free; Unreal's 5% royalty applies only above $1 million revenue per game
Mountains and terrain	Terrain Tiles on AWS, or Copernicus 30 m elevation data	Free, credit required
Rivers, lakes, coastlines	OpenStreetMap	Free, credit required
Satellite imagery	EOX Sentinel-2 cloudless 2016	Free, credit required

Limits

- The free imagery is about 10 m per pixel: sharp from the air, blurry up close on the ground.

- The converted terrain must be hosted for players to download: a modest storage and traffic cost that grows with players, but no fee per player.
- Never use EOX's 2018 to 2025 layers: they are non-commercial.

Paid options to skip

- Cesium ion: needs a paid plan for a game you sell.
- Google Photorealistic 3D Tiles: billed to you for every use, which gets expensive with many players.
